DNB General Surgery Paper3

Question Number : 1

A 76-year-old hypertensive male presented with dry gangrene of right great toe. He has history of pain on walking for last few months. On clinical examination, his femoral and distal pulses on both sides are not palpable. Describe probable diagnosis, evaluation and management of this patient. [1+4+5]

Question Number : 2

a) A 7-month-old child presents with abdominal distension for last few days, passing greenish stool, no complain of vomiting, no complain of blood in stool. USG abdomen suggests ileo-ileal intussusception (transient on repeat USGs). How will you manage this patient. [5]

b) A 2 days old neonate presents with persistent bilious vomiting and lethargy. X-ray abdomen is suggestive of Double bubble sign. What is the diagnosis? Describe the treatment of this patient. [1+4]
